DEPARTMENT OF
PSYCHOLOGY

Serial or Parallel?

- How do basic visual features (e.g., color and shape) influence attention?
- Example: Treisman and Gelade (1980)
 - Parallel stage: Features processed in separate salience maps
 - Serial stage: Each item is attended one at a time and its features are bound into a coherent object
- Search slopes (right) often used as evidence

FIG. 1. Search times in Experiment I.

Search Slopes Cannot Distinguish Serial or Parallel

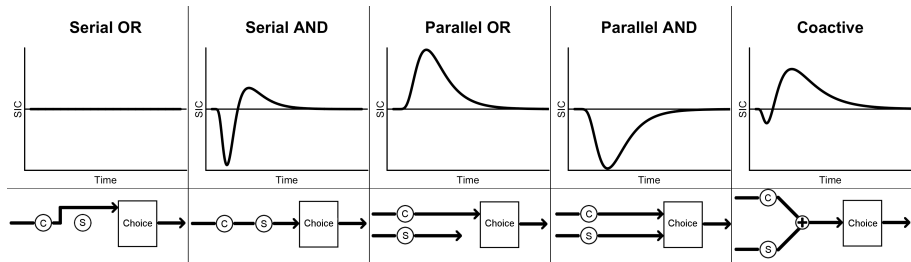

- Search slopes do not control for workload
- Potential for model mimicry (Townsend, 1972; Little et al., 2017; Townsend and Nozawa, 1995)
 - Example: limited capacity parallel models can produce positive search slopes
- Other methods have been developed
 - Multifeature Whole-Report Paradigm (Kyllingsbæk and Bundesen, 2007)
 - Redundant Target Paradigm (Miller, 1982)
- The opportunity exists for more direct evidence for parallel or serial processing

Study Goals

- Use Systems Factorial Technology (Townsend and Nozawa, 1995) to investigate the temporal organization of color and shape feature processing in visual search
 - Feature dimensions – NOT items
- We hypothesize color and shape to be processed in parallel
 - Many prominent theories assume parallel feature processing at some point (e.g., Wolfe, 2007; Bundesen, 1990)
- We will explore any trends in workload capacity or variation in stopping rule

Systems Factorial Technology

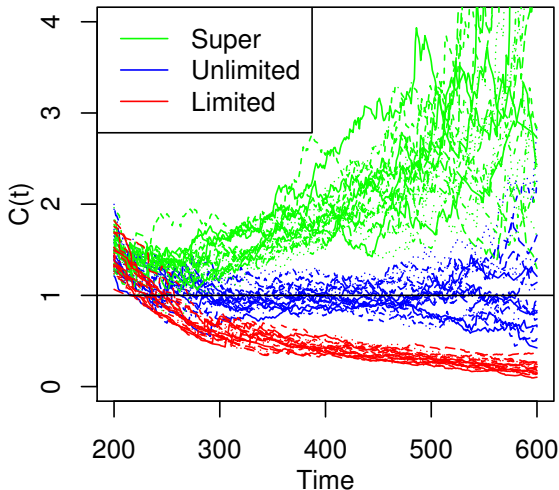

$$SIC(t) = [S_{LL}(t) - S_{LH}(t)] - [S_{HL}(t) - S_{HH}(t)]$$

$$MIC = [\overline{RT}_{LL} - \overline{RT}_{LH}] - [\overline{RT}_{HL} - \overline{RT}_{HH}] = \int SIC(t) dt$$

Workload Capacity

Capacity Coefficient

$$C_{\text{OR}}(t) = \frac{H_{1\dots n}(t)}{\sum_{i=1}^n H_i(t)}$$

$$C_{\text{AND}}(t) = \frac{\sum_{i=1}^n K_i(t)}{K_{1\dots n}(t)}$$

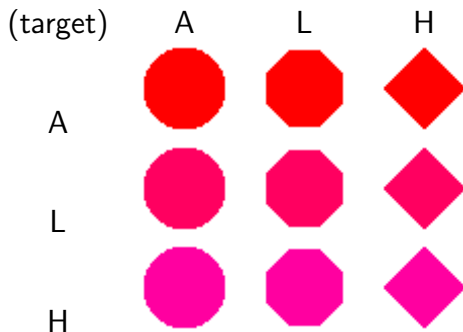

Baseline Model:

Unlimited **C**apacity
Independent **P**arallel
(**UCIP**) Processing

General Method

- 15 subjects in each experiment
- Always 24 items in display
 - Randomly placed and available until response
- Target present on half of all trials
 - Yes/No response
- Manipulate target-distractor dissimilarity
- Three blocks per session, 4-5 sessions (drop first)
 - Two single-feature blocks to measure UCIP baseline
 - Dual-feature block to measure SIC and MIC

Experiment 1 — Feature Search

Degree of dissimilarity to the target

A: Absent, **L:** Low, **H:** High

Experiment 1 — Feature Search

Results — SIC and MIC

Experiment 1
Target Present SIC

Experiment 1
Target Absent SIC

Bayesian Group MIC:

$$\hat{\rho}_+ = .91$$

$$\hat{\rho}_+ = .91$$

Results — Workload Capacity

Target Present

Target Absent

LH

LL

LH

LL

Discussion of Experiment 1

- Reject all serial models and independent, exhaustive parallel models
 - Target Present: All positive SIC and MIC
 - Target Absent: 7/15 subjects had significant negative SIC deviations as well, suggesting coactive processing
- All subjects demonstrated super (AND) capacity
- However, the task did not force a single strategy
 - Template-matching strategy (AND)
 - Singleton-search strategy (OR)
- Experiment 2 (conjunctive search) and Experiment 3 (odd-one-out search) designed to control for strategy

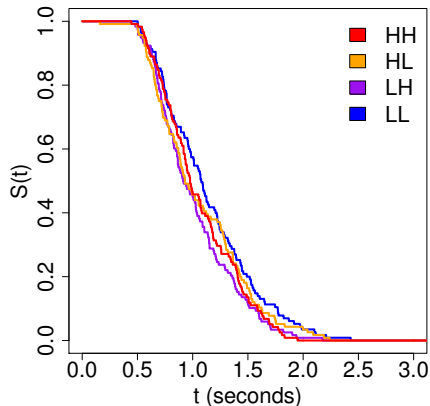

Experiment 2 — Conjunction Search

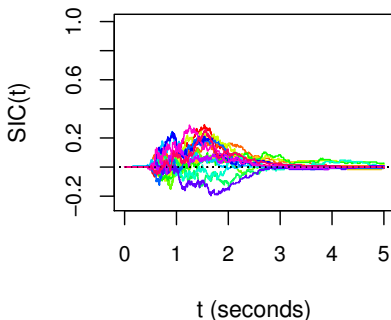

Results — Target Present

Selective Influence Failed — Unable to Interpret SIC and MIC

Example Survivor Functions

Experiment 2
Target Present SIC

Results — SIC and MIC

Experiment 2
Target Absent SIC

Bayesian Group MIC: $\hat{p}_+ = .88$

Results — Workload Capacity

Target Present

Target Absent

HL

HH

HL

LH

LL

LH

LL

Discussion of Experiment 2

- Target Absent
 - Reject all serial models and independent, exhaustive parallel models
 - All positive SIC and MIC
 - All subjects demonstrated super capacity
 - Coactive processing seems to be the more likely model
- Target Present
 - All subjects demonstrated super capacity
 - Could not infer architecture
 - Why did selective influence fail?
 - Heterogeneous distractors may have introduced grouping effects

Experiment 3 — Odd-One-Out Search

Experiment 3 — Odd-One-Out Search

Results — SIC and MIC

Experiment 3 Target Present SIC

Bayesian Group MIC: $\hat{p}_+ = .80$

Results — Workload Capacity

Target Present

Target Absent

Discussion of Experiment 3

- Target Present
 - Reject all serial models and independent, exhaustive parallel models
 - All positive SIC and MIC
 - 2 subjects had significant negative SIC deviations as well, suggesting coactive processing
 - Subjects demonstrated unlimited capacity
- Target Absent
 - Mixture of unlimited and (mostly) super capacity
 - Could not infer architecture (no meaningful target-distractor dissimilarity)

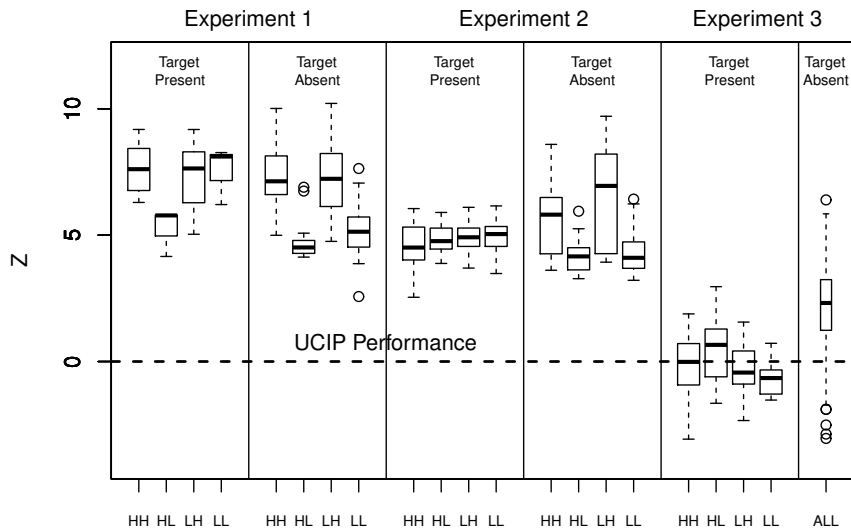

Summary of Results

Architecture Across Experiments

Capacity Across Experiments

Capacity Z-Scores

General Discussion

- We investigated feature search, conjunctive search, and odd-one-out search
- Color and shape feature dimensions are processed in parallel
- Processing may be facilitatory dependent
- Supports existing theories of visual attention (e.g., Wolfe, 2007)
- Future work needs to confirm these conclusions in target-present conjunctive search and target-absent odd-one-out search
